

# I just wanna hold your hand

---

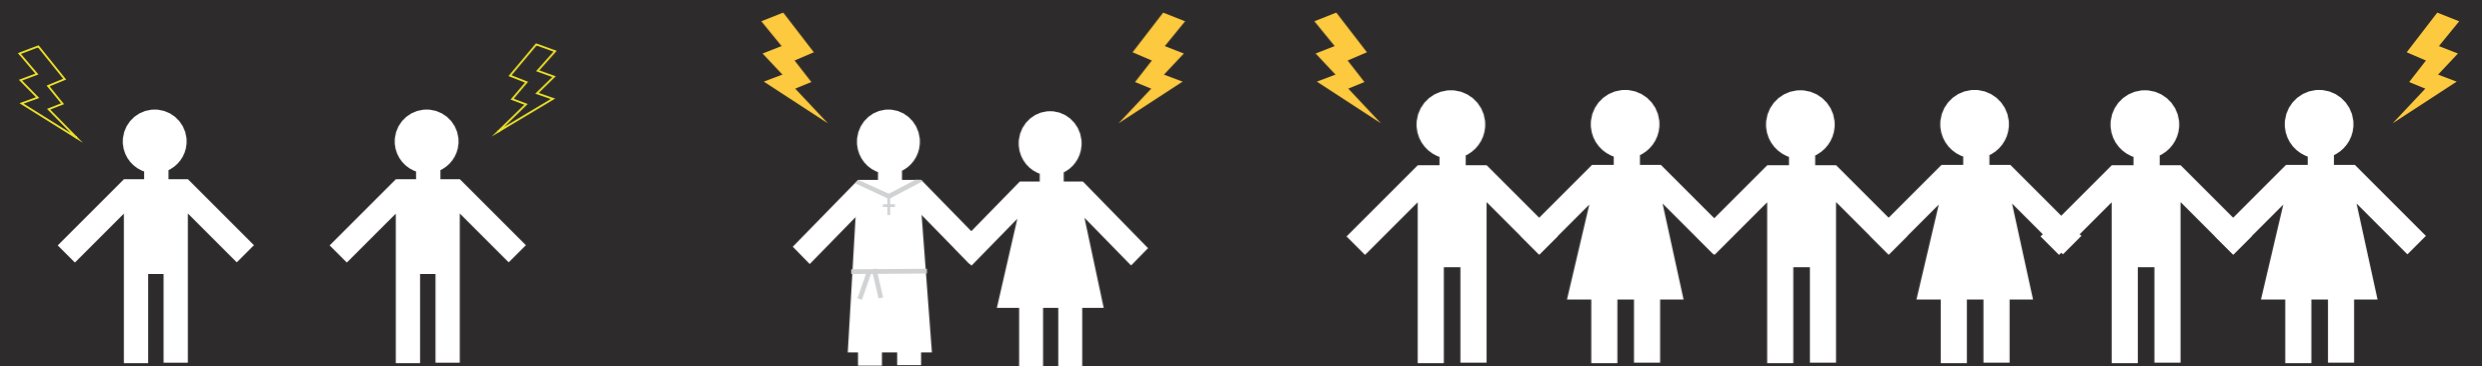

Conducting energy through people to stimulate tangible public interactions.

# project description

By interacting with one another people are able to transform their environment through play. Two metal hands are mounted to the wall. When two or more individuals complete the circuit they provoke audio-visual responses. The level of interactivity is determined by the flow of electricity through the individuals. The interaction can be tailored per installation; the core tool is the Arduino, and in this case we've experimented with Processing projections to activate blank city walls, storefronts, or pavement. This design allows for expansion as well as meaningful data collection. Also, we just like making people hold hands.

## how it works

the experience
